Art Unit: 1625

Claims 1-4,8,10,11,13 and 23 are rejected under 35 U.S.C. 102(b) as being anticipated by Hachmuth et al. for essentially the reasons of record. In response to the new limitations note that the instant pressures for the absorption are taught at p. 4, lines 57-69. The absorbent is taught to be an absorption oil of molecular weight of about 200 is the same as recited in the instant claims.

Claims 1-6,12,14-22,24-27 and 29-42 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hachmuth et al in view of Jubin, Jr., US Patent 5,468,885. the former is used as above. The latter discloses that absorption processes have been used to absorb propylene from the purge gas of propylene oxide production processes. Thus it would have been obvious to apply the technique taught by Hachmuth et al in absorbing olefins such as propylene or ethylene from the purge gases from an epoxidation of olefin process.

Applicant's arguments filed 6-16-2006 have been fully considered but they are not persuasive. C₁₄H₃₀ hydrocarbon which must make up at least 10% by weight of the instant absorbent has a molecular weight of 198. The reference's disclosure of an absorbent oil having a molecular weight definitely anticipates this.

Applicants argue in p. 14, paragraph 2 that "Moreover, the preferred temperature range disclosed in the patent is significant (see page 4, right hand column, lines 65-69) is significantly higher than the pressure recited in the instant claims." This is a non sequitur. Further, the pressures recited therein of 300-850 and preferably 500 to 750 lb/sq. in. are not distinguished by applicants' recitation of a pressure of more than 10 to 20 bar.

Because of the new reference used the rejection is not final.
